I want to make a digital camera
use python
, for example if many people are walking in front of the camera, here the camera starts counting people, if there is a person registered in the system before, it directly brings his name and his photo.

And if the person is talking on the phone or with another person, it directly records his speech, or any movement made, the camera photographs and saves, for example there are visible movements that have meaning, but on condition that there is AI.

And if the person has glasses, it must understand whether these glasses are for vision or for AI security camera or something else, if there is something dangerous it directly makes a lot of noise with a loud sound and says the person has something dangerous, people should stay away from him and it says his name and the dangerous thing, for example a knife or weapon or something hostile forbidden to enter in a meeting or international airports.

And AI translates the whole matter, movements or speech, all of it.

And if the person asks anything, it directly photographs and saves the photo and brings him the knowledge of the company.

And again, it photographs the person, if he has clothes, on the screen it appears without clothes, but this is in case an unknown person appeared and wants to make serious problems or his personality is not known and we don't have or there is no one we trust in him, and here we are forced to photograph in the same way for safety, but the photo directly records data and fingerprint and photos and saves directly, but this camera will be in its own special work because we don't open it in all cases, only in necessary cases.

But this camera is not working in all cases, only in certain cases, in cases of risks only, as for the rest of details it must photograph.

And again it makes a system with AI camera, for example on a car road, it directly photographs the car plate directly and saves, for example on a road many cars are running or moving on the road, here the camera directly photographs the plates of any car, whether rear or front, and brings me the name of the car company directly and the model of the car, on condition that it is accurate by the plate number or car number.

And again, it makes a system with AI camera, for example if I raise my hand in a greeting form, it translates it as greeting, if another movement, it brings the meaning of the movement because every movement has its meaning and it must bring or translate the meaning of the movement.

And again there is something called notification language, AI must understand what this person means in the sign or his movement and here it must understand accurately.

There will be an AI agent ask assessment because sometimes there are deep questions we ask it and it brings its liking.

And final words, I want this project as a website, but I want the complete project all with details accurately.
